Labelling buckets with handle.

Special solution.

Labelling on one side and option for 2 sides.

Large or small labels.

Perfect horizontal label position.

Print options.

EME has developed a new compact system for labelling conical shaped buckets with handle, on the side.

The system can place the label in the area between the mounting points for the handle and the label will follow the shape of the bucket and sit in correct horizontal position.

It can handle buckets in size from 2½ liter to 15 liter.

Furthermore, it can be adjusted to label also a flat, vertical side of a container within the same dimensions.

The buckets must be placed on the conveyor with the handle lifted to a vertical position and placed between the centered guides. It will be transported to the applying station and stopped by a pneumatic system, in the center of the applying unit.

The label is pre-dispensed and is held by vacuum on the applying unit, which brings the center of the label on to the center of the bucket and out to both sides. This method ensures, that the label is sitting horizontal and follows the conical shape of the bucket surface.

The adjustments for each size of bucket, are stored in the system memory.
